

THE NORTH STAR

Answers in minutes.

Show your work.

Today, supply chain decisions wait for analysis — and the analysis arrives too late to change the outcome. When a number does arrive, nobody can see where it came from, so it gets second-guessed or ignored. **Krutrim is a working digital twin of a fulfillment center: a live, running model of the operation.** It is built and it runs today. Right now it shows the building. The next stage makes it answer questions about the building.

WHAT CHANGES

THE DECISION TODAY	WITH KRUTRIM
"Do we make the 16:00 carrier cutoff?" — a meeting next week	Answered in minutes, with the assumptions attached
Staffing planned on industry averages	Staffing planned on your workforce's actual performance
Policy changes trialled on the live floor, at real risk	Trialled on the twin first, at no risk
Automation business cases built on vendor claims	Built on a simulated baseline of your own operation

THE PATH

1	See it. A real twin of the building — real dimensions, real products, real equipment.	BUILT
2	Run it. A simulation of the operation: orders, labour, flow. Answers <i>what if</i> .	NEXT
3	Live it. Connected to the real feed. Answers <i>what if, starting from right now</i> .	PLANNED
4	Trust it. Validated against your real numbers. Then it recommends. Then, where it has earned it, it acts.	PLANNED

WHY IT CAN BE TRUSTED

Most AI hands you an answer you have to take on faith. Krutrim hands you the answer **and its reasoning** — which inputs it used, which assumptions it made, and what would have to change for the answer to flip.

Speed gets you asked. Showing your work gets you trusted.

WHAT WE'RE ASKING FOR

1	Fund stages 2 and 3 — the simulation engine and the live feed.
2	Name one real data source to connect to.
3	Give us the first decision you want answered in minutes.
